

Project Readiness Guide

What to bring to your first conversation with Techniek Engineering

A short, well-organized document set helps Techniek Engineering move quickly from the issue to a practical recommendation. Use this guide to gather the right evidence before the first conversation so the discussion stays focused on decisions, not document hunting.

How Techniek can help

- " Engineering Support: practical technical review, documentation, and problem-solving so a decision has a clear basis before scope, cost, or schedule moves.
- " Project Management: structured planning, coordination, and progress tracking that keeps owners, engineers, contractors, and operators aligned on the same picture.
- " Energy Management: performance guidance that turns energy data into specific actions, owners, and follow-up checks.

Bring the right evidence (by area)

Mechanical / equipment issue

- " Drawings, photos, trend data, reports, and maintenance history.

Civil / facility question

- " Condition notes, site photos, inspection records, utility maps, and known constraints.

Project control

- " Schedules, logs, meeting notes, decision history, and current blockers.

Energy action

- " Bills, interval data, BAS exports, occupancy and operating schedules, and operating limits.

Frame the conversation

- " Name the asset, facility, or project phase involved.
- " State the decision, blocker, or deadline that matters most.
- " Keep controlled or client-confidential files off public channels until a

secure intake path is agreed.

Secure document handling

Do not submit FCI, CUI, export-controlled technical data, credentials, pricing, or client-confidential records through public channels. Controlled project artifacts should use an owner-approved secure intake path and be reviewed before any public summary is created.
